Vision SPE Vacuum Manifolds

Vision Solid Phase Extraction Vacuum Manifolds allows you to process up to 10, 12, 20 or even up to 24 SPE tubes. Precise flow control is provided by independent, screw-type valves.

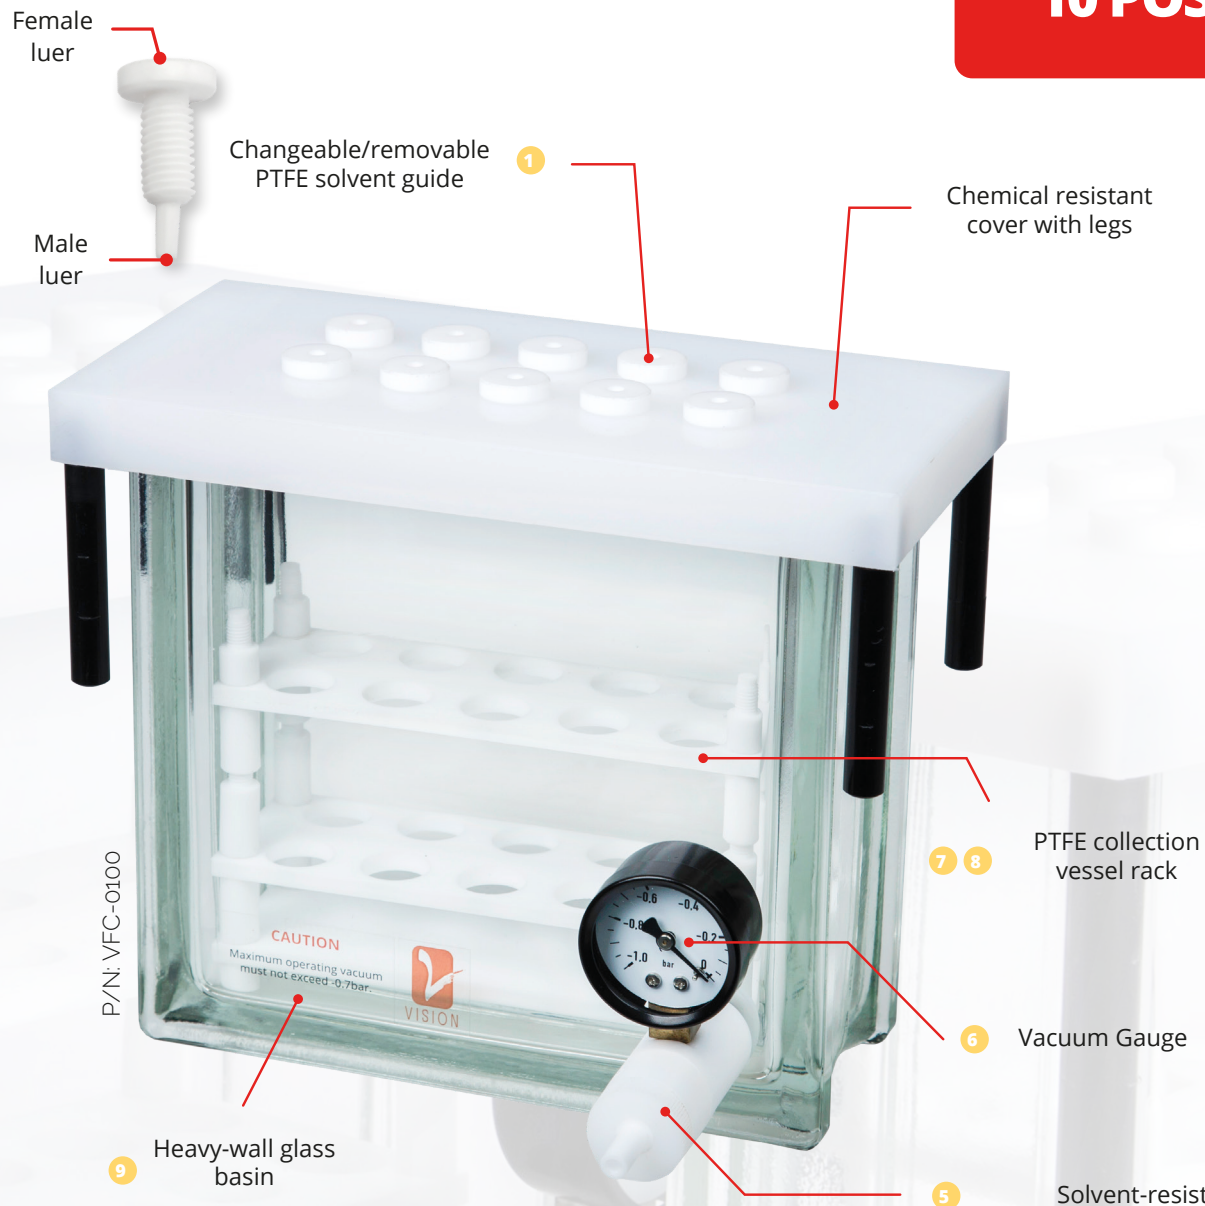

A solvent-resistant PTFE vacuum bleed gauge and valve offer better sealing and vacuum control, via precision mechanism fitted with a PTFE seal rotating ring. The stand-alone PE cover with legs prevents the Teflon solvent guides from resting on the work surface and becoming dent or contaminated. The heavy-well glass basin will not dissolve, fog, or discolor when exposed to solvents.

The PTFE collection vessel rack accommodates 16mm, 18mm or 25mm test tubes and compatible with centrifuge tubes.

A Vision (Straight Liner) Solid Phase Extraction Vacuum Manifold eliminates the possibility of cross contamination from one sample set to the next in the same manifold port.

A changable/removable PTFE solvent guide runs through each port. The guide acts as a liner, ensuring that all surfaces that come in contact with the sample can be replaced or washed following each extraction. The PTFE luer hub fits with thread into a threaded slot on the PE cover. The PTFE luer hub consists a male luer connector on the bottom to accommodate all type of luer female needles.
